

A report you are prepared to endorse

Read → Inspect → Check → Revise

Name / group: _____

Date: _____

You are reviewing a proposed wearable-signal report before it is shared with the person it describes. All records are synthetic. Use only the materials released so far. Record what you would retain, revise, or withhold and why. A reasoned decision to retain an artifact is valid; the task is not to find a fixed number of errors.

1. Read: identify the carrier of quantity

Using Card 0, explain what the historical instruction asks a reader to measure. How might the most noticeable geometric property differ from the encoded quantity?

2. Inspect: make an initial judgment

Using Card 1, state one provisional interpretation of the candidate report. For the unannotated sector pair, give a ratio and mark the geometric object on which your answer depends. Record uncertainty rather than guessing which statistic the plot contains.

Initial interpretation and geometric basis

Which feature definition, time window, units, and valid observations would you request?

3. Check geometry: compare implementation and declaration

After Card 2, evaluate candidates A and B. A larger/smaller answer is not enough: state the ratio your chosen geometric reading gives and whether it agrees with the stated encoding. Explain any change to your initial judgment.

Candidate	Retain / revise / withhold	Evidence and proposed change
-----------	----------------------------	------------------------------

A

B

A question you would ask your review partner:

An evidence-linked revision

Complete after the feature and coverage releases

4. Check feature and temporal support

Using Card 3, decide whether candidate C is consistent and what should change in candidate F. Distinguish a label change from a computation change. Name the feature, window, duration, and units; explain what a scalar cannot establish about burst timing.

Candidate	Retain or change what?	Code, definition, or check supporting the decision
C		
F		

5. Check coverage: separate observation from inference

After Card 4, explain why two summaries can differ without changing the observed samples. Does using only valid samples reveal the complete interval? Distinguish acquisition gaps from quality-excluded readings. How should a bin with no valid samples appear?

6. Revise: account for the statement you will release

Return to the initial interpretation on page 1. Submit revised code/annotations and a final caption. Name one statement you retained, revised, or withdrew and the evidence responsible for that decision.

Final interpretation, including the evidence boundary

Decision trail: earlier claim → new evidence → action

What additional evidence would a stronger interpretation require?

Submission check. Account for all four layers: geometry, feature semantics, temporal support, and valid observations. Include the claim, repair, unresolved support, and source/edit record. A visually improved report without these explanations is not a complete audit. For a live-model run, attach the model, date, prompt, output, and edits.
